

-Answer to the Question.no-01

Answer to the Question no-02

I have designed an ER diagram of a hospital management system. The data requirements are given below:

The following info about hospitals are stored: Hospital ID (unique), Name, location. Hospital has assigned many doctors. Doctor salary, doctor ID (unique) and personal information are stored. ^{A Doctor can be assigned by several hospitals.} Personal information consists of name and phone number. And Name has first name and last name. Patients can take appointments to visit any doctor. When an appointment is made, an appointment fee is stored. The unique patient ID, age, age group (child, senior, adult etc) are stored for all patients. If a patient is a close family member of another previous patient then their relation can be stored. Hospital has many nurses. Their years of experience are stored. This year

of experience means the number of years a nurse has worked in the hospital. Nurse has nurse name, nurse id (unique) and joining year. Every nurse checks every patients' basic conditions. A nurse is assigned to a room. Room has the nurse ~~id~~ (which nurse is assigned to the room), room number. Only one nurse is assigned to one room.
